STATE-OF-THE-ART TECHNOLOGY

☑ Modern scientific techniques: uses HPLC, GC, TLC, UV/VIS, IR, ICP etc.,to monitor and control the quality of products.

☑ Fingerprint Technology: identifies the fingerprint code of each botanical.

☑ Essential Oil Recover Technology: involves the recovery of therapeutic essential oils during the decoction process; combined with the use of the Cyclodextrin procedure to maximize the amount of essential oils and other fragile compounds in the final product.

☑ Low Temperature Vacuum Concentration - prevents active constituents from substantial loss in high temperature and maintains maximum efficacy.

☑ Spray Drying - instantly dries the extracts for better retention of active constituents, particularly for heat sensitive constituents. This also better solutes the product for better absorption in the body.
